Anchor paper: Isiani, A., Weiss, L., Bardaweel, H., Nguyen, H., Crittenden, K. (2023). Fault Detection in 3D Printing: A Study on Sensor Positioning and Vibrational Patterns. *Sensors*, 23(17), 7524. doi 10.3390/s23177524

Section	Paragraphs	The job it does	Our equivalent
Title, authors, abstract, keywords	1 (abstract)	Gives the whole study in one paragraph: what was tested, how it was analysed, and the headline result (nozzle sensor 71% more sensitive).	Front matter
1. Introduction	3	Argues why 3D printer failures and nozzle clogs matter, reviews earlier vibration and monitoring studies, then names the gap this paper fills and what it adds.	Section 1 Introduction (paragraph 1), Section 2 Literature review (paragraphs 2 and 3)
2. Materials and Methods	11 (Figures 1-6 and Table 1 first cited here)	Describes the printer, sensors and set-up, how the clog was created by lowering temperature, the test conditions, and the analysis steps.	Section 3 Proposed approach (analysis steps); Section 4 System design (printer, sensors); Section 5 Evaluation methodology (test conditions). All mixed in one section
3. Results and Discussion	13 (Figures 6-17, Tables 2 and 3)	Shows what each sensor and method found, compares FFT with spectrograms and PCA with SVM, and argues which sensor position works best.	Section 6 Results and Section 7 Discussion and limitations, combined
4. Conclusions	1	Sums up the key frequencies and the best sensor position, and states future work.	Section 8 Conclusion and future work
Author contributions, Funding, Institutional Review Board, Informed consent, Data availability, Conflicts of interest	6 short statements	Required journal declarations. They carry no argument.	none
References	45 entries	Lists every source cited, mostly in the Introduction and Methods.	References
